

CP5218 Submersible Level Transmitter for deep wells

Serial n° : Nominal range :

Cable length : 10 meters +

GENERAL FEATURES

Water level measurement, control and process for wells and boreholes, with a very narrow diameter of 18mm

TECHNICAL PRINCIPLE

The level measurement is performed through the differential pressure measurement between liquid surface and the submersible sensor. The pressure is converted into electric signal by piezo-electric gauge to provide a 4/20mA output signal on 2 wires

MECHANICAL SPECIFICATIONS

Housing: Stainless steel 316L

Cable: 2 wires + internal tube in shielded FEP cable

Sensor: Stainless steel gauge

Diameter: 18 mm

Height: 180 mm (without cable)

Weight: 210 g (without cable) Supplied normally with 10 meters

of shielded cable (475 g) or more upon request

Fitting: by the suspension cable supplied with a hanging system

KITCAB

ELECTRICAL SPECIFICATIONS

Output signal: 4/20mA output signal on 2 loop wires, 4mA for 0m and

20mA for the full-scale

Power supply: Voltage supply between 6 to 38 volts DC input. (Don't

forget to integrate the voltage drop-out in the current loop)

Check the voltage specification of the protector unit

EMC Conformity: EN 50 081-2, EN 50 082-2 Consumption: the signal value (mA)

TECHNICAL DATA

Water column range: Full-scale (F.S.) between 10 m to 500 m. (Full-scale

20mA adjusted to the required value by Hitec)
1 to 50 bars. P(bars) = H(meters) / 10.197

Equivalent pressure: 1 to 50 bars. P(bars) = H(meters) / 10 Hysteresis: 0,10 % F.S. (constant temperature). Non-linearity: 0,15 % F.S. (constant temperature).

Temperature operating range : from 0°C to 95° Celsius

CP5218 Submersible Level Transmitter for deep wells

OPERATING INSTRUCTIONS

Electrical connections:

The operating instructions are very easy. No need signal adjustment (fitted in laboratory)

The cable is fitted with an internal small tube for atmospheric pressure compensation. Don't block or pressure the tube. Don't put the end of the cable in water or flooding area During the installation, check the correct position of the cable without dangerous roughness or sharpness. Don't use any sharp tool for fitting: risk of water infiltration.

Check the correct polarity of the connections: the inversion of polarity is not destructive; in this case, the signal drops to 0mA.

Connect the lightning protector (PSE30V) on a very good earth line. Provide a power voltage supply sufficient to compensate the drop-out in the current loop and be sure to get a 6VDC minima on the transmitter: Measure the total electrical resistance of the line (included all electronic systems) and apply the following formula:

U(supply mini) = 6V + (R line x 0.02 A). In the most cases, a 12 or 24 VDC supply is sufficient

Warning: Following the lightning protector unit fitted with the transmitter, **PSE43V** or **PSE30V**, the power voltage max. is **38V** for PSE43V and **27V** for PSE30V.

TROUBLE-SHOOTING PROCEDURE

Transmitter checking: Disconnect the transmitter from the system; Connect the transmitter on a battery (12VDC or small square 9VDC battery) and introduce a milli-amperemeter in the loop. Check the current value: 4mA with the transmitter out of water and atmospheric pressure, and 20mA for the full-scale height of water.

For intermediate value : H (meter) = (Signal (mA) - 4mA) x F.S.(meter) / 16, and conversely : Signal (mA) = ((Height (m) / F.S.(m)) x 16) + 4mA
